

What it does

Enforces drug licence compliance for wholesale, distribution and manufacturing — inside Business Central. Licence rules are defined once per product group, real licences are recorded against customers and suppliers, and every sales and purchase order line is validated automatically against released, in-date licences.

Compliance flow

Only Released records count — an Open licence set or company licence is invisible to validation.

Get started in three steps

- 1 Define & release a Licence Set** — conditions per item category and attribute; scope by country and posting group; choose warning or error.
- 2 Assign & release Company Licences** — link the set to each customer or supplier with the official licence number, grant and expiry dates. Conditions copy across automatically.
- 3 Trade as normal** — every item line on sales and purchase documents is checked silently the moment it is entered.

Key facts

Instant validation

Checks run on item entry — orders, invoices and blanket orders. No extra clicks for users.

Dates decide validity

The order date must fall between the licence's grant and expiry dates.

Items drive matching

Controlled items must carry the right item category and attribute values.

Your strictness

Per licence set: a confirmable warning or a hard block, with your own message text.

Visible everywhere

Fact boxes show active / expiring / expired counts; lists highlight expired licences in red.

Role-based control

Admin permission set maintains licence sets; User set maintains company licences.

Validation outcomes on order entry

Valid licence

line accepted silently
